Aim of this Document

This document contains an introduction to the LoRaWAN stack available in GitHub for the WiMOD LR radio module family (e.g. iM880B, iM881A and iM980A).

Table of Contents

1. INTRODUCTION	3

1.Introduction

1.1 Overview

This document contains a guidance on the setup of the LoRaWAN™¹ open source code available in GitHub running, including the installation and handling of a free GNU toolchain.

The next chapter provides the details to install and configure the required tools to develop an own LoRaWAN application under Windows 10 following the instructions in the *development-environment.md* file available in the GitHub documentation, where Visual Studio Code is chosen as source code editor and MinGW as Make utility needed to generate the executable files.

Furthermore, an example application for the WiMOD LR radio modules is shown.

¹ LoRa is a Trademark of Semtech Corporation / LoRaWAN is a Trademark of LoRa Alliance

2.Setup

Before starting any interaction with the LoRaWAN example code, the following components are required:

- **IMST Started Kit including Radio Module:** e.g. iM880B-L, iM881A-XL, iM980A
- **Programmer:** an ST Link V2 programmer with an adapter PCB (available from IMST) is recommended for downloading the hex file into the microcontroller or for debugging purposes.

Fig. 2-1: ST Link V2 programmer

- **Integrated Development Environment (IDE):** for this document *Visual Studio Code* is used.

A free version (e.g. *VSCode-win32-x64-1.28.0.zip*) is available under:

<https://code.visualstudio.com/Download>

- **GitHub Source Code:** available under:
<https://github.com/Lora-net/LoRaMac-node>

For this, the *Git* application is required. E.g. *Git-2.19.1-64-bit.exe* under
<https://git-scm.com/>

The *TortoiseGit* interface (<https://tortoisegit.org/>) could be used to gain access easily to the latest source code.

And the following prerequisites should be met:

- **CMake:** version equal to or greater than 3.6 is required.
This (e.g. *cmake-3.12.3-win64-x64.msi*) is available under:
<https://cmake.org/download/>

Note: Please use the latest full release.

- **GNU Arm Embedded Toolchain:** available under:
<https://developer.arm.com/open-source/gnu-toolchain/gnu-rm>

E.g. *gcc-arm-none-eabi-7-2018-q2-update-win32-sha1.exe*

- **Make utility:** for this document *MinGW* is used. This is available under: <http://mingw.org>

E.g. here *mingw-get-setup.exe* is available under *downloads*.

Thanks to this application, the required packages could be installed. These should be selected and then click on **Apply Changes** under **Installation**.

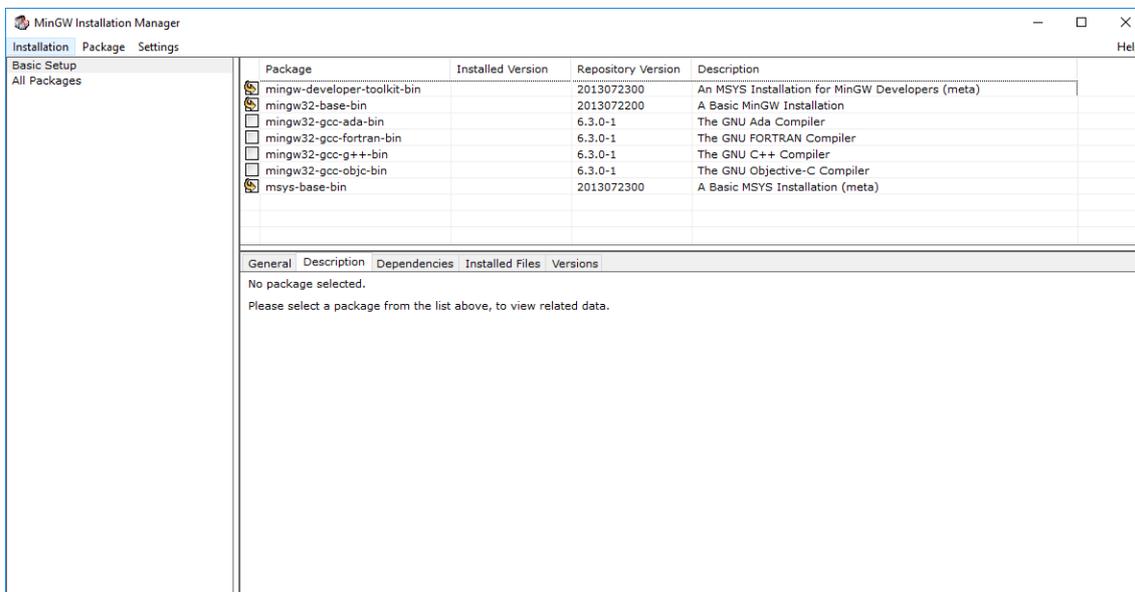

Fig. 2-2: MinGW – Example of installation

- **OpenOCD:** unofficial binary packages are available under <http://openocd.org/getting-openocd/> for download.

E.g. *gnu-mcu-eclipse-openocd-0.10.0-8-20180512-1921-win64.zip* under <https://github.com/gnu-mcu-eclipse/openocd/releases>. Unzip and copy the content of "*gnu-mcu-eclipse-openocd-0.10.0-8-20180512-1921-win64\GNU MCU Eclipse\OpenOCD\0.10.0-8-20180512-1921*" into "*C:/openocd*".

- Ensure that the following paths are added to the system *Path* variable:
 - CMake (e.g. "*C:\Program Files\CMake\bin*")
 - MinGW (e.g. "*C:\msys64\mingw64\bin*")
 - GNU Tools ARM Embedded (e.g. "*C:\Program Files (x86)\GNU Tools ARM Embedded\6 2017-q2-update\bin*")

For example, on Windows 10 followings steps could be followed:

- Click on **Settings** (under the *Start Menu*) and then on **System**:

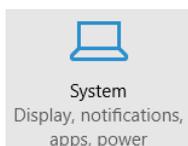

Fig. 2-3: Windows 10 - System

- Choose **About** and then **System info**:

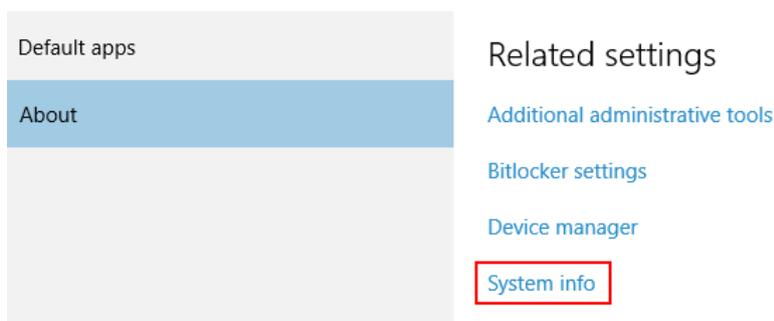

Fig. 2-4: Windows 10 – System info

Note: The same window could be open with the **System** option on the **Control Panel**.

- Click on **Advanced System Settings** and select **Environment Variables**:

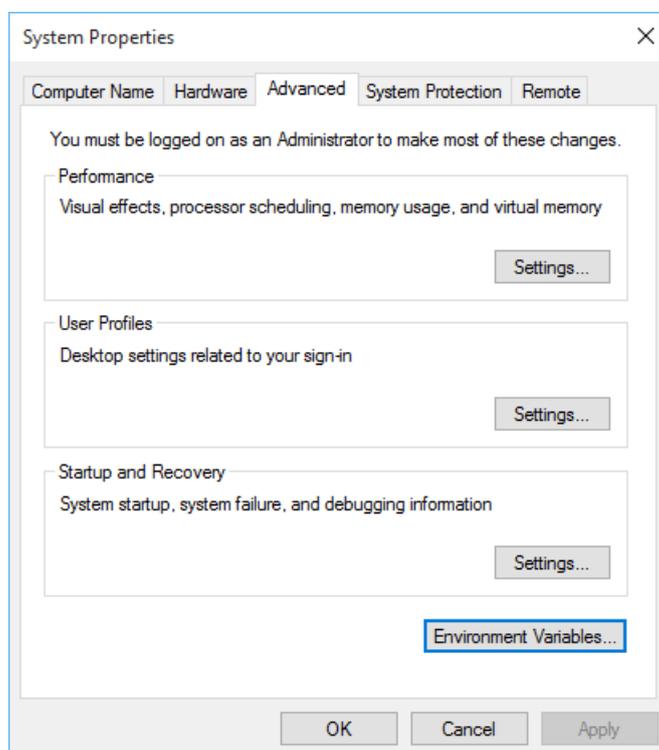

Fig. 2-5: Windows 10 – Environment Variables

- Add the required paths to the Path variable

Finally, the Visual Studio Code should be configured correctly:

- Install the required extensions. For this, open Visual Studio Code and search for the following extensions after clicking Ctrl+Shift+X:
 - C/C++

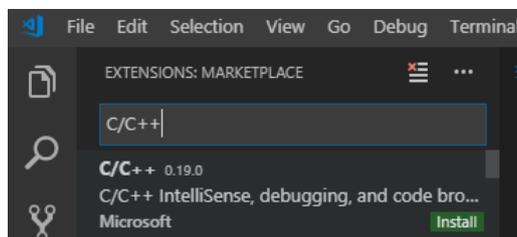

Fig. 2-6: Visual Studio Code – C/C++ extension

- CMake and CMake Tools

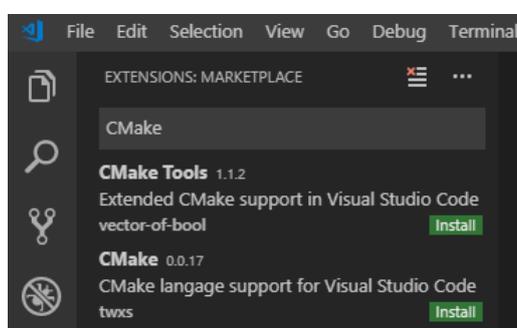

Fig. 2-7: Visual Studio Code – CMake and CMake Tools extensions

- Native Debug

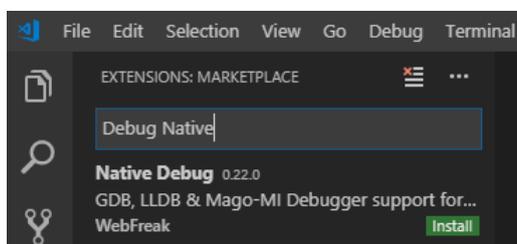

Fig. 2-8: Visual Studio Code – Native Debug extension

- Add CMake configuration to the user settings. For this, select **File>Preferences>Settings** and open `settings.json`.

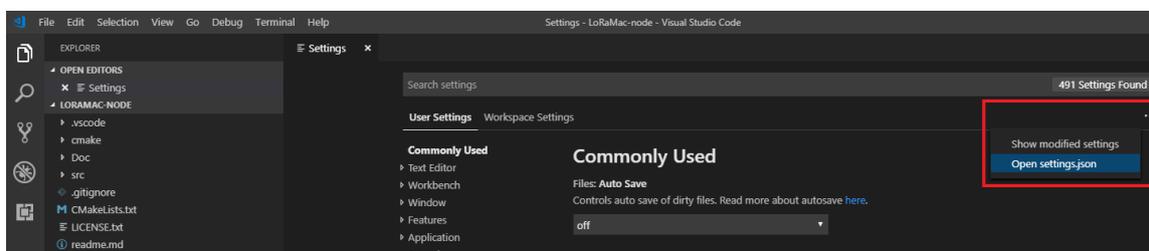

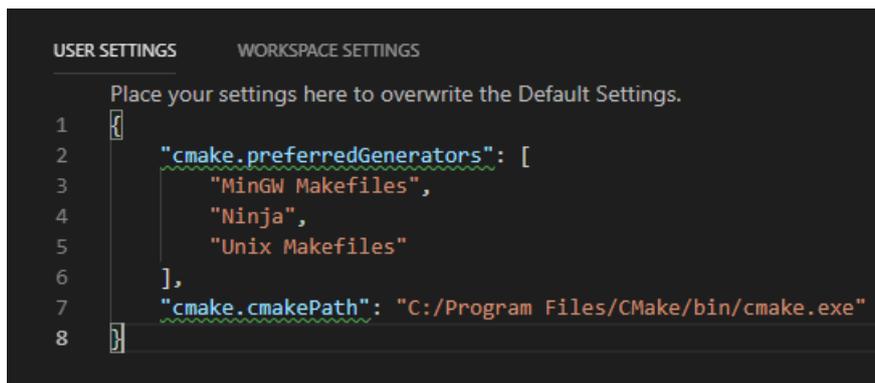

Fig. 2-9: Visual Studio Code – User Settings

Add the configuration needed for CMake as shown in the next picture:

```
USER SETTINGS  WORKSPACE SETTINGS
Place your settings here to overwrite the Default Settings.
1  [
2    "cmake.preferredGenerators": [
3      "MinGW Makefiles",
4      "Ninja",
5      "Unix Makefiles"
6    ],
7    "cmake.cmakePath": "C:/Program Files/CMake/bin/cmake.exe"
8  ]
```

Fig. 2-10: Visual Studio Code – User Settings (CMake)

- Open the directory with the cloned repository selecting **File>Open Folder** and select e.g. *LoRaMac-node*.

Here, the *CMake Tools* extension will automatically generate a **.cmaketools.json** file based on the *CMakeLists*.

- Modify the workspace settings as required (*settings.json* file under the *.vscode* folder). E.g:
 - "TOOLCHAIN_PREFIX": "C:/Program Files (x86)/GNU Tools Arm Embedded/7 2018-q2-update"
 - "OPENOCD_BIN": "C:/openocd/bin/openocd.exe"
 - "CMAKE_TOOLCHAIN_FILE": "cmake/toolchain-arm-none-eabi.cmake"

3. Demo Application

This chapter explains the steps needed to build the ClassA end-device example application using an iM880B radio module (available under `LoRaMac-node\src\apps\LoRaMac\classA\SKiM880B\main.c`).

Following steps are needed:

- Modify the workspace settings as required for the application (`settings.json` file under the `.vscode` folder). E.g:
 - APPLICATION: LoRaMac
 - CLASS: classA
 - ACTIVE_REGION: LORAMAC_REGION_EU868
 - BOARD: SKiM880B
 - REGION_EU868: ON

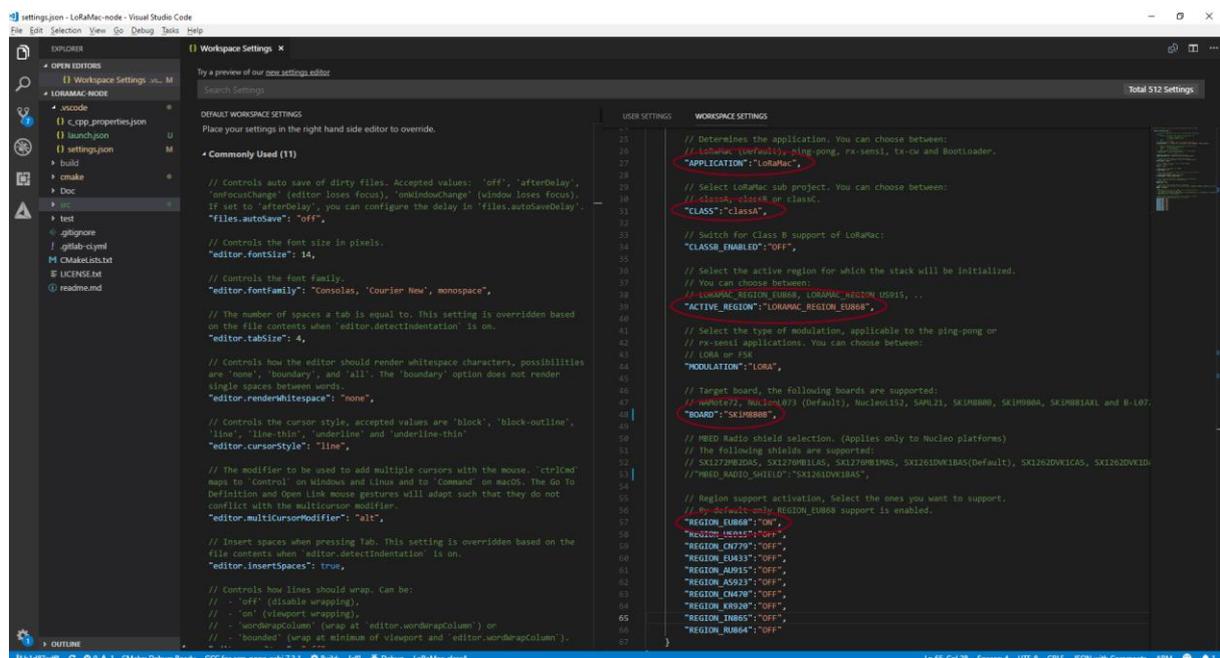

Fig. 3-1: Visual Studio Code – Workspace Settings

- Click on the blue status bar of CMake Tools to choose a build type (Debug or Release).

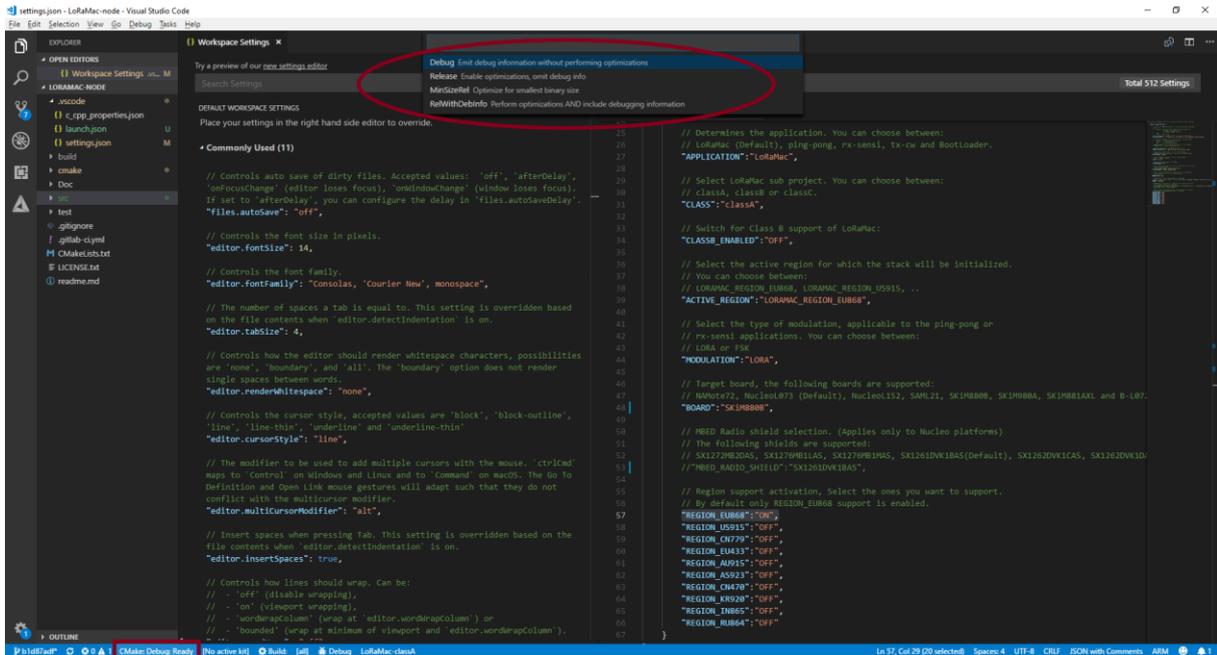

Fig. 3-2: Visual Studio Code – CMake Tools Settings

- Select the GCC compiler (e.g. GCC for arm-none-eabi 7.3.1) clicking on [No active Kit] on the blue status bar.

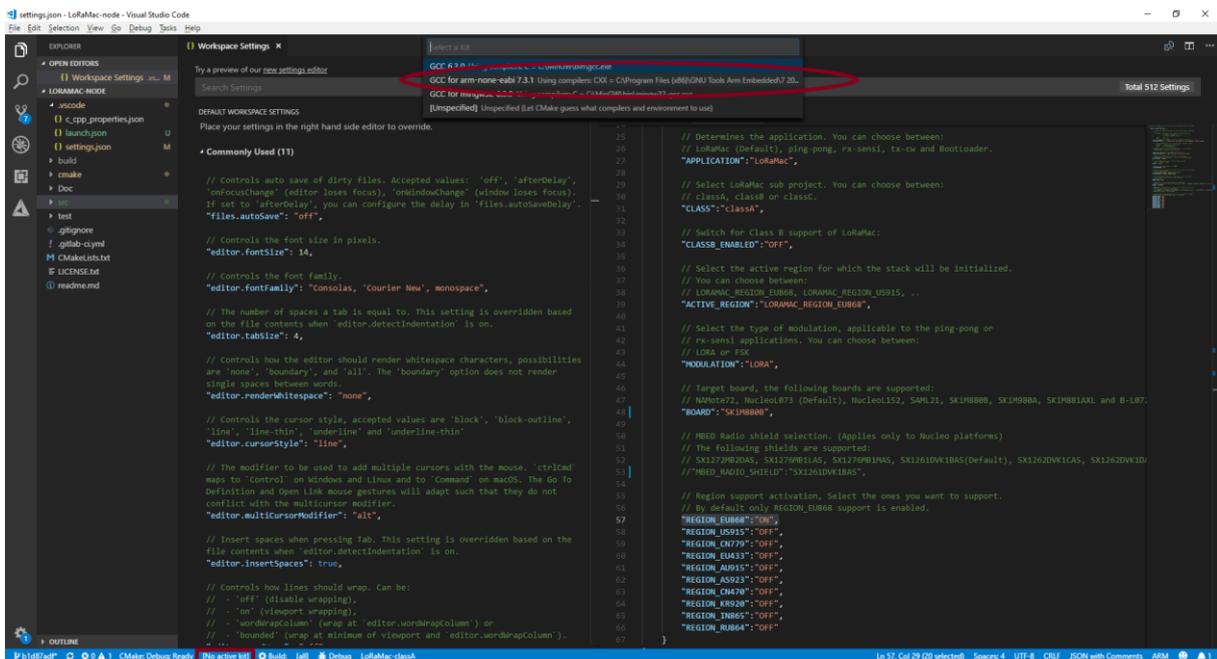

Fig. 3-3: Visual Studio Code – GCC Compiler Settings

- A Build option will be now available on the blue status bar. This will build the target.

Fig. 3-4: Visual Studio Code – Build

The binary file (e.g. LoRaMac-classA.hex) will be available under the build directory (e.g. `build\src\apps\LoRaMac`) and could be programmed into the iM880B radio module, e.g. using an ST Link V2 programmer.

The CMake build system will automatically generate a `*launch.json*` file which setups the debugging process for the given board.

After this, the F5 key could be used to start a debug session. This will automatically start the GDB and OpenOCD processes.

Note: Please follow the next steps for a new build after any modification of the application/configuration:

- Change CMake options: Open the Command palette (Ctrl+Shift+P) and type **CMake: Edit the CMake Cache**

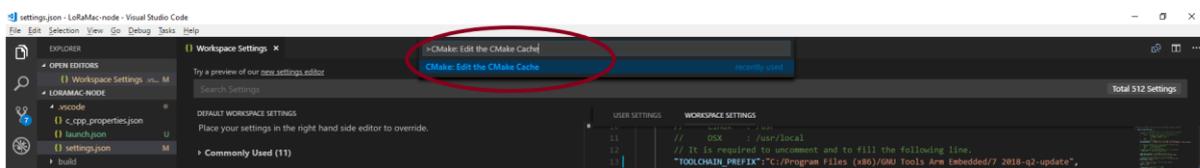

Fig. 3-5: Visual Studio Code – CMake Settings

- Execute a clean rebuild: Open the Command palette (Ctrl+Shift+P) and type **CMake: Clean rebuild**

Moreover, within this application the radio module provides details concerning its configuration and radio messages exchange via the USART serial communication (configured with 912600 baud rate). For this, a terminal emulation program for the serial interface (e.g. TeraTerm) could be used:

- Create a new connection to the serial port.

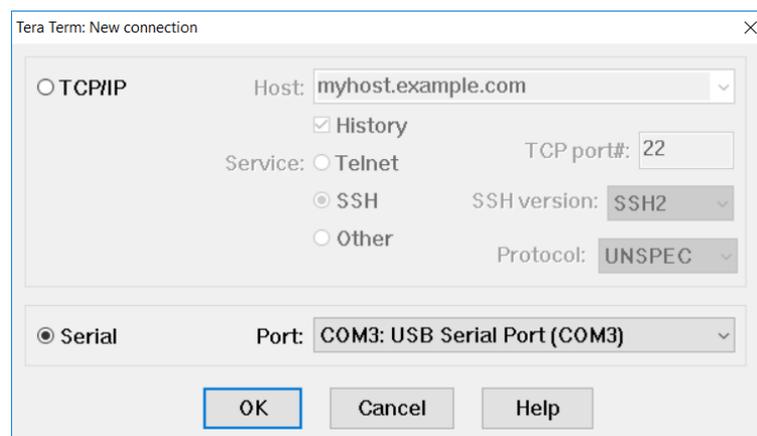

Fig. 3-6: Tera Term – New Connection

- Configure the baud rate under **Setup>Serial port...**

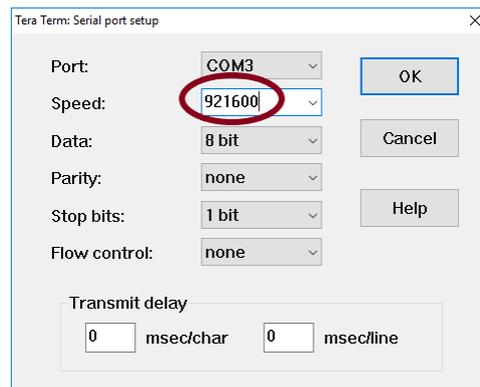

Fig. 3-7: Tera Term – Serial port setup

- Then the data sent by the radio module via the USART interface is shown as follows:

```
