1. Introduction

1.1 Overview

This document is an extension to the ProLink LoRaWAN® EndNode Modem HCI document [1], covering the changes included in the ProLink LoRaWAN® EndNode Modem firmware for EU 863-870 MHz ISM Band.

2. Additional Firmware Services

This chapter describes the message format for the additional firmware services in detail. The services are ordered according to their corresponding endpoint.

2.1 LoRaWAN® Services

2.1.1 RF Sub-band Configuration

The following parameters related to the RF sub-bands can be configured via HCI:

- **Tx Power Limit**
a transmit power limit could be configured for each sub-band included in the operating ISM band. If the status flag is activated, the configured transmit power limit value will be applied, otherwise the default values will be used.

The firmware provides the following services for read-out and configuration.

Note: after a Factory Reset the RF Sub-band configuration will always be reset to its default setting (see 2.1.1.3).

2.1.1.1 Read Tx Power Limit Configuration

This message can be used to read the transmit power limit configuration parameters.

Note: this message is only available for the regions supporting different RF sub-bands definitions (see appendix 3.1).
